

ABSTRACT

A module connects a network having a power mains to a housing. The module includes a platform for holding electrical components. The platform includes a body made of a
5 fiber-composite material and reinforcing glass fibers, a busbar in the body, and a contact element associated with the busbar for making contact with the busbar. A hood is connected to the body. A functional unit is in the hood. The functional unit includes at least one capacitor per current phase of the power mains.
